# eM4

Since its launch in 2007, eM4 has protected hundreds of millions of e-mails requiring compliance-mandated encryption. Its popularity stems not only from its proven encryption algorithm, but how it elegantly solves the lack of interoperability, affordability and IT resources required with competitive solutions.

Your users continue to send emails as they always have, the only noticeable difference is the reassuring message that their email was protected by eM4. Designed to integrate with all popular enterprise e-mail clients, eM4 automatically encrypts messages and their attachments firewall to firewall. It is simple and a great wrap of protection to your existing way of sending emails!

Advantages

- Effective for B2B / B2C communications
- No logins or passwords
- B2C model does not require authentication
- Simple encryption rules
- Three deployment options
- B2C large attachment support
- No user training
- Easily scalable to thousands of users
